ANNUAL REPORT

OF THE

BOARD OF TRUSTEES

FOR THE YEAR

1900

CHICAGO

THE UNIVERSITY OF CHICAGO PRESS

1901

CHICAGO

THE UNIVERSITY OF CHICAGO PRESS

1902

This report presents (1) rates and frequencies of admissions for all causes and (2) incidence of selected communicable diseases in the continental naval stations and Marine Corps activities. All admissions and incidence rates are computed as annual rates per 1,000 reported average strength.

For individual stations the reports are presented as numbers of cases, rather than rates, to facilitate evaluation of reports from small station. The average strength of each individual station is furnished so that rates may be calculated where desired.

The admission rate, total for all causes, is calculated from the total number of A's (New Admissions) and RA's (Readmissions), which comprise the number of individuals taken up on the sick list from a duty status. It should be noted that these rates are computed on an annual basis, and indicate the number of admissions per 1,000 average strength which would occur over a year's time if the current week's experience continued for a year. The formula for computation is as follows:

$$\frac{\text{Number of Admissions (A\&RA) During Week X 52}}{\text{Average Strength for Week}} \times 1,000$$

The incidence rate measures the number of new cases of a specific diagnosis or group of diagnoses occurring within the strength during a particular period. This rate is computed from the total of A (New Admissions), ACD (Admitted Contributory Disability), AD (Additional Diagnosis) and EC (Diagnosis Established or Corrected). The computation of rates for incidence follows the formula set up for admission rates by inserting incidence in place of admissions.

Since patients may be transferred to naval hospitals before a diagnosis is established, the category DU (Diagnosis Undetermined) is now included in this report. Some of the cases reported under Diagnosis Undetermined will ultimately be established and reported under one of the specific diagnoses, included in this publication. Therefore, comparison of the incidence of DU's in a group of stations with the incidence of a specific diagnosis as reported by the hospitals serving those stations, will provide a rough indication of the diagnosis to which the DU's are eventually assigned. To facilitate such comparisons, hospitals are listed separately under the stations of each Naval District and included in the totals for the district.

Caution should be exercised in the interpretation of this data compared to that published prior to 23 November 1946 in the Weekly Morbidity Report. Previously, the rates were derived from A's (New admissions) only. Present reporting provides a more complete picture of morbidity in the continental activities of the Navy and Marine Corps.

CURRENT TRENDS

INFLUENZA

During the week ending 8 March, 226 cases of influenza were reported by continental activities. This represents an increase of 115 or 103.6 percent over the 111 cases reported for the previous week. Of the 226 cases, 195 were in the 8th Naval District distributed among four activities as follows: 170 - NATechTraCen, Memphis; 13 - NavHosp, Memphis; 10 - NAS, Memphis; and 2 - NAS, Dallas. Only six other stations reported more than a single case, and these stations were distributed among four of the districts.

The present spurt in the incidence of influenza began 15 February with 11 cases and since has increased by weekly steps of 46, 111 and 226. The concentration of the incidence, to date, however, does not preclude the possibility of a more wide spread outbreak before the seasonal cycle of the disease begins to decline.
